DX Series

OpDX™ *Butterfly Control Valve*

OpDX Control Valve

The high performance OpDX, rotary valve uses a pressure assisted seating concept, to achieve a bi-directional bubble-tight shutoff while maintaining low breakout torque, specially at every first opening actuation, at both high and low pressure drops. It is available in ANSI Classes 150 thru 2500 and in sizes from 2 to 30-inch. OpDX is available in carbon steel, stainless steel and other alloys. The seat design assures low breakout torque by utilizing the pressure drop across the valve to aid the seating process. Combined with a high-thrust cylinder actuator and eccentric-cammed disk, it is possible to achieve a high performance throttling – even under large pressure drops in the valve.

OpDX's Eccentric Cammed Disk

A double offset has been designed into the disk to lift it out of the seat immediately upon opening actuation, this avoids wear on the seat and disk, by reducing leakage and parts replacement. It also improves throttling by eliminating friction.

OpDX

Seating Principles

The OpDX seating concepts utilize the pressure drop across the valve to force the soft seat to bubble-tight shutoff in either flow direction, including alternating flow applications. It is done in such a way that seating capacity is increased, as differential pressure is increased. The soft seats achieve ANSI Class VI shutoff.

Table I: Seat Leakage

Metal Seat	ANSI Class IV
Soft Seat	ANSI Class VI
Flow Seat	2% of Rated C_v
Double Seat	ANSI Class IV

Figure 3

As pressure enters the seat cavity formed between the seat and the shaft downstream, the seat jams into the disk, causing it to seat tighter against the disk.

Figure 4

As pressure enters the seat cavity formed between the seat and the shaft upstream, the seat tends to toggle into or flatten out, causing it to seal tighter against the disk.

Flow Direction

OpDX allows two different operating directions: shaft upstream or shaft downstream, depending on service conditions. With the shaft downstream, the flow tends to open the valve, and with the shaft upstream the flow tends to close the valve.

Whenever possible it is recommended that OpDX valves be installed with the shaft downstream so as to result in a lower dynamic torque when the valve is open. On liquid service, with the shaft installed upstream, the forces produced from liquid inertia can cause system and valve serious problems such as waterhammer or flow instability as the valve closes.

For gas service, if the flow must assist fail-open applications, the valve must be installed with the shaft downstream and with the shaft upstream if flow must assist fail-closed applications.

However shaft installation must be always upstream if the flow must assist fail-closed applications and to insure the valve disk moves to the closed position.

For liquid services, all the valves must be installed with the shaft downstream whatever fail-safe application is required.

Figure 5: Flow Characteristics

Figure 6: Flow direction

Flow Characteristic

The inherent characteristic of OpDX is a modified parabolic characteristic curve. Other characteristics are available by simply replacing the positioner cam to obtain the proper characteristic curve required.

Other cams for flow characteristics such as inherent linear and equal-percentage as well as a linear rate between signal and shaft rotation are also available.

OpDX

Disk, Seats

Disk

OpDX body and disk assembly was designed to ensure a wide range of flow capacity. The concave profile on one side of the disk allows for an increased flow capacity while reinforcement ribs on the other side prevents the disk from flexion effects specially under high differential pressures. The disk is also provided with a disk-stop to protect the seat from damage due to overstroking.

Soft Seat

OpDX soft seat maintains a properly designed configuration that provides a bubble-tight shutoff equal to ANSI Class IV to be achieved.

Dual Seat

OpDX dual seats incorporates both soft seat and the flexible lip metal seat for added protection.

Metal Seat

Metal seats are used for applications involving higher temperatures than those permitted by the soft seat. The design incorporates a highly flexible lip which assures full circle contact between the seat and disk when the valve is closed.

Because of lip flexibility, breakout torque for the metal seat is the same or less than soft seat breakout torque. OpDX metal seat assures a tight shutoff above that of ANSI Class IV.

Flow Direction

The tight shutoff system allows OpDX to flow either shaft downstream or shaft upstream, depending on service conditions.

Seat Configurations

Figure 7: Soft Seat

Figure 8: Metal Seat

Figure 9: Dual Seat

Features and Advantages

Soft Seat

- Bubble-tight shutoff , according to ANSI Class VI
- Low breakout torque assures accurate throttling, even close to the seat
- Flow -free profile
- Easy removal

Metal Seat

- Tight shutoff superior to ANSI Class IV

Eccentric-cammed disk

- Disk pulls out of seat immediately, preventing seat wear
- Accurate throttling due to disk profile when rotating into the seat

Single pivot-point, splined shaft

- Lost motion minimized between shaft and actuator

Bolted seat retainer

- Uninterrupted gasket surfaces allows for a wide variety of gasketing

Non-selective disk and shaft

- Easy maintenance
- Reduced cost – replace part needed, not entire assembly

Flangeless body (wafer)

- Rugged and lightweight for easy handling and maintenance; one body (wafer) serves ANSI Classes 150, 300 and 600 in sizes 2, 3, 4, 6 and 8 inches.
- Industry standard MSS SP-67 permits shorter flange bolting than ball or cammed valves, increasing safety and reducing possibility of leakage.

Flow capacity

- Capacity greater than globe, plug and cammed control valves.

Concave disk

- Increased flow capacity

Disk stop in the body

- Prevents damage to seat due to overstroking
- Permits in-line disk relocation during maintenance

Wide variety of packing configurations

- Purged bonnet and lubricator options

Fully enclosed, air plugged transfer case

- Extra safety
- Prevents environment corrosion to actuator parts
- Disk position indicator mounted on the transfer case

Piston and cylinder actuator

- High thrust for high-performance throttling in extreme pressure drops
- Compact and lightweight for easier servicing and maintenance
- Fully interchangeable with rotary valves actuator
- Actuator air pressures allowable up to 150 psi

Wide interchangeability

- Spare parts stocking requirements minimized
- Inventory costs reduced
- Many parts of other Optimux products interchangeable with OpDX

Available in a variety of materials

- Carbon steel, stainless steel and other alloys

Seat interchangeability

Metal or Teflon seats easily installed

Spool-type four-way position

- High performance with double switch
- P/P and I/P convertible
- Calibration and maintenance easy due to fewer parts

The combined features designed into OpDX create a valve measurably superior to all other rotary valves. The information and specification contained in the following pages are provided for comparison.

OpTK Actuator

RA Piston Cylinder Actuators

Optimux's Series RA Piston-Cylinder-Rotary-Actuators are an excellent actuation choice to obtain maximum performance of our **OpDX** eccentric plug control valves. The Optimux Series RA piston cylinder rotary actuators with fail-safe spring combine high torques with pneumatic stiffness which together deliver excellent throttling characteristics. The Series RA compared to regular spring-diaphragm actuators, are lightweight, compact, efficient and in general, they take a smaller foot-print for installation in pipelines, they are simply, one of the best choices in actuation systems for rotary control valves.

The Series RA piston cylinder actuators are offered as our standard offer for all of our Rotary valves: Series XL and Series VB.

The Optimux Series RA piston cylinder actuator was designed to work with supply pressures of up to 150 psi (10.3 bars), which significantly increases torque capacity. The Series RA performance and reliability in the field has no par, as it has proven life service above one million cycles.

The pneumatic stiffness achieved by the Series RA assures excellent throttling and control characteristics specially in near closing control positions.

Table II: Rotary Actuator Specifications

Type	Double-acting piston and cylinder with fail-safe spring
Sizes	25, 50
Action	Air-to-open Air-to-close Last position Field reversible
Operating Pressure	Max 150 psig Max 10,3 bars
Stroking Speed	≤ 1 second
*Temperature Range	-40° to 350° F (-40° to 175° C)
Auxiliary Handwheels	Declutchable side-mounted handwheel Lever-gear operated handwheel Lever operator
Positioners	Digital HPP-3000 Digital HPP-3500

Figure 10: RA Rotary Actuator

Table III: Construction Materials

Yoke	Ductile iron
Transfer Case	Anodized aluminum
Splined Lever Arm	Nickel-plated ductile iron
Stem	UNS S 41600 Stainless Steel
Bearings	Filament wound fiberglass with Teflon liner
Sliding Seal	Delrin, aluminum
Retaining Ring	Cadmium plated steel
Piston	Anodized Aluminum
Cylinder	Anodized Aluminum
O-Ring*	Buna-N (standard)
Actuator spring	Coated steel (rust proof)
Spring button	Cadmium-plated steel

* Ambient temperatures greater than 180° F (82° C) require Viton O-rings. Ambient temperatures below -40° F (-40° C) require fluorosilicone O-rings.

Rotary Actuators, Features and Characteristics

RPA Rack and Pinion Actuators

Optimux's Series RPA represent an excellent alternative to our RA Piston-Cylinder Series for rotary valves applications. As with the RA Series the RPA actuators are compact, allow for field reversibility, provide adequate torque for most standard applications and are easy to maintain. RPA actuators are designed for extremely long cycle life when utilized in normal loading applications. The RPA actuators will take service temperatures of -10° to 275° F (-23° to 135° C).

The Series RPA actuators are also offered for all our rotary valves: Series XL and Series VB.

Table IV: Double Acting Torque Values (in. Lbs)

PSI	40	60	80	100	120
RPA052	263	395	526	658	789

* Other model numbers and torque options are also available

Optimux® HPP4000 Smart Valve Positioners

Our new HPP4000 brings to the market all the field proven attributes of our former HPP3000 plus all the additional features our users have requested for the past few years: LCD Display, 4-20mA feedback signal, HART® communication protocol and Auxiliary Limit Switches, all of these within our legendary and well proven robust enclosure capable of sustaining the most rigorous industrial plant conditions.

But this is not all, the HPP4000 was designed to accurately position your control valve and to operate it efficiently at the lowest possible air consumption (LPM) below 3 LPM @ 100 psi.

Optimux® HPP4500 Smart Valve Positioners

Our new HPP4500 microprocessor equipped, current-to-pneumatic digital positioner is a reliable, accurate and robust positioner which offers as a standard many features and technical characteristics traditionally offered as options by other digital positioner's manufacturers.

The HPP4500 offers as a standard, Hart® communication, 4-20mA Feedback Signal and a LCD display.

OpTK Packings

The **OpDX** rotary valve is built with a large packing box which gives a longer service life to the packing assembly. The **OpDX** Packing box design allows for the use of a large number of packing system options, and fully complies with the most demanding fugitive emission control regulations in modern industrial processes.

Standard Packing

The **OpDX** standard packing set is composed by PTFE “V” rings, Figures 14A and 14B. The PTFE “V” rings are the most used packing system since their introduction, providing exceptional tight sealing. They provide a very low friction coefficient, good mechanical resistance and excellent resistance to corrosion. The PTFE “V” rings are the most common application choice for gasketing material.

The PTFE “V” rings are used within temperature ranges of -150° to 450°F (-101 to 232° C). High Temperature Packing The **OpDX** formed packing rings, Figures 15A and 15B, is an alternative choice whenever the operating temperature exceeds that determined for the use of PTFE “V” rings. The materials employed in the formed packing rings of the **OpDX** are braided PTFE for use in temperatures up to 500°F (260°C) and Grafoil for use in temperatures up to 752°F (400°C). The Grafoil formed packing rings are an excellent choice whenever packing is subjected to high operating temperatures, however it should be noted that the demand of high forces required to achieve a tight sealing results in a significant friction increase forces as the valve plug turns.

Special Packing

The PT type packing set, Figure 16A, is composed by a set of “V” type rings under compression by an assembly of disc springs that result in a “live-loading” effect. This system achieves a sealing level of below 500 ppm. The PT type packing combines the superior virgin PTFE “V” rings quality with the PTFE “V” rings combined with carbon filament wound. The PTG type packing, Fig. 16B, is composed of an advanced packing set that is capable of keeping a sealing rate very below 500 ppm (at a 10 ppm step rate). The PTG packing set is composed by the combination of PTFE “V” rings with carbon filament wound and Kalrez® “V” rings, an advanced material that provides a superior performance to the packing set. For temperatures higher than 450°F (232° C) the PTG XT packing set is employed. This type of packing utilizes Zymax® rings instead the PTFE/carbon rings.

(1) The ANSI B16.4 standard specifies pressure/temperature limitations for the valve bodies.

Consult our Engineering Dept.. for additional information.

(2) If the appropriate body and bonnet materials are used.

(3) 8 to 12-inch, Class 150-600; and 3 to 12-inch, Class 900 – 2500 can be used to 850°F (455°C).

(4) Asbestos-free, high temperature packing.

(5) Do not use Grafoil above 800°F (427°C) in oxidizing services such as air or oxygen.

(1) Select seat material and find the ΔP (ibf/inch²).

(2) Values shown at left are considered for shaft upstream; values at right for shaft downstream.

(3) Make sure that seat material selected complies chemically with the process flow media.

* Body according to MSS SP67.

OpDX

Additional Information

The following information is required when ordering a OpDX control valve:

1. Preferably, the body size and eventual limitations of assembly and disassembling dimensions.
2. Original operating conditions: upstream/downstream pressures, temperature, flow rate, specific gravity or molecular weight of the fluid, steam pressure or gas compressibility factor.
3. Maximum temperatures and operating pressures.
4. Body and disk pressure class.
5. Material required for the body, disk, shaft, packing and bearings.
6. Pipeline diameter and schedule.
7. Actuator data type: (pneumatic or hand-operated). Fail-safe position, shut off pressure, and minimum air supply pressure.
8. Mounting orientations.
9. Accessories required.

The information and specification described in this brochure are considered as accurate. However these are for information purpose only and should not be considered as certified information.

Considered that Optimux products design are continuously improved and upgraded, specifications, dimensions, and information described herein are subjected to change without notice.

For further information or verification, consult your Optimux representative. Specific instructions for the installation, operation, troubleshooting and maintenance of the Optimux control valves are contained on the Optimux Maintenance bulletin.

Hastelloy C is a trade mark of Cabot Corporation
Monel, Inconel are trade mark of Huntington Alloy
Teflon is a trade mark of E. I. DuPont Company
Stellite is a trade mark of Stooly Debro
